

# FENCE WRAPS

Maximise your brand exposure and make your site secure & private. All fence wraps come with welded hems for extra strength & durable metal eyelets at 400mm spacings. We have three grades to choose from; Max, Lite or Flow. If you need more help please call us on (03) 963 8899 or email [info@cq.co.nz](mailto:info@cq.co.nz)

## FENCE MESH GRADES

### MAX

Max is your go to product for quality images. Its close weave gives you maximum privacy and a bigger surface area for lots of ink – more detail and brighter colours.

**Sizes available**

- 1.8m high x 50m length rolls.
- Custom cut panels - 1.8m high x required length.
- Custom heights and lengths.

### LITE

Lite is the mesh with the best of both worlds, a bit of Max and a bit of Flow. You'll get pretty good privacy and a fair amount of wind can pass through. You won't get fine detail, but the image quality is on the money and colours retain their vibrancy.

**Sizes available**

- 1.8m high x 50m length rolls.
- Custom cut panels - 1.8m high x required length.

### FLOW

Flow is our most popular fence mesh, being the most comparable product to its inferior cousin Shade Cloth. The open weave lets ample wind through, but in doing so sacrifices a bit of image detail and vibrancy. That said, it is a stunning product that will serve you well.

**Sizes available**

- 1.75m high x 50m length rolls.
- Custom cut panels - 1.75m high x required length.

## CARING FOR YOUR FENCE WRAP

### How to extend the life of your fence wrap.

- Install your fence wrap with cable ties at the correct spacing.
- Ensure that there is good tension and your fence wrap is not sagging or loose.
- Regularly check the condition of your fence wrap and make adjustments.
- Store your fence wrap rolled up – do not fold and store.
- Do not use harsh cleaners. Spot test first. Use soapy water to remove dirt.

Life expectancy can range from 6 to 36 months. Environmental and care factors will dictate the life of your product. If possible, exposed fence wrap should be taken down when gale force winds are predicted.

Cable tie every eyelet when installing fence wrap. Failure to do so will lead to premature failure.

### What reduces the life of fence wrap?

#### UV EXPOSURE

The sun's UV rays cause the ink to fade. The colours fade at different rates so they won't necessarily fade in a uniform fashion. The mesh coating will also discolour and break down over time.

#### WIND

Fence wrap exposed to regular windy conditions will deteriorate faster. The friction speeds up the process of the mesh breaking down.

#### ABRASION

If your fence wrap is loose, flaps in the wind or rubs an object, it will be subjected to extra stress and will deteriorate faster.
